## Aplicatie SCADA pentru managementul surselor regenerabile de energie

In aceasta aplicatie este simulate o casa independent de energie cu panouri solare cu posibilitatea de a primii energie electrica de la retea cand este nevoie.

## **Functionare**

In timpul zilei panourile solare genereaza energie care este inmagazinata in 4 baterii de condensatoare.

In acelasi timp, daca este nevoie, panourile solare pot alimenta si diferite aparate electrice din casa dar in acest caz bateriile de condensatoare sunt incarcate mai greu in functie de putere consumata de aparatele electrice.

In cazul in care panourile solare nu pot face fata consumatorilor electrici din casa sistemul se conecteaza automat la reteaua electrica.

Cand consumul de energie electrica scade reteaua electrica se deconecteaza automat.
